

ABSTRACT

5 A system and method for implementing an emergency response system is
provided, wherein a package is sold to an end user, access to a cellular
communications network is provided to the user, and at least a portion of the collected
revenue is used to fund a safety control center that receives emergency signals
conveyed from the location of the end user through an emergency network. The
safety control center contacts an emergency entity in response to the emergency signal
10 to provide emergency services. Another portion of the collected revenue may be used
to fund a carrier associated with the cellular communications network.
